3 Description	Circuit Diagram
<p>The GT810X, families of products offer low voltage operation and rail-to-rail input and output, as well as excellent speed/power consumption ratio, providing an excellent bandwidth (8kHz) and slew rate of 3.7mV/μs. The op-amps are unity gain stable and feature an ultra-low input bias current.</p> <p>The devices are ideal for sensor interfaces, active filters and portable applications. The GT810X families of operational amplifiers are specified at the full temperature range of -40°C to +125°C under single or dual power supplies of 1.4V to 5.5V.</p>

5 Voltage, Temperature, ESD and Thermal ratings

5.1 Absolute Maximum Ratings⁽¹⁾

Parameters	Min.	Max.	Unit
Supply Voltage $V_s=(V^+)-(V^-)$		6.5	V
Select Input Voltage ⁽²⁾	(V ⁻)-0.5	(V ⁺)+0.5	V
Maximum Junction Temperature	-55	150	°C
Storage Temperature Range	-55	150	°C

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.

(2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.3V beyond the supply rails should be current-limited to 10mA or less.

5.2 ESD Ratings

ESD			Value	Unit
V(ESD)	Electrostatic discharge	Human-Body Model (HBM) ⁽¹⁾	5.5 K	V
		Charged-Device Model (CDM) ⁽²⁾	2 K	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

8 Detailed Description

The GT810X families of products are rail-to-rail operational amplifiers that can be run from a single-supply voltage 1.4V to 5.5V ($\pm 0.7V$ to $\pm 2.75V$). Supply voltages higher than 6.5V (absolute maximum) can permanently damage the amplifier. Rail-to-rail input and output swing significantly increases dynamic range, especially in low-supply applications.

Attention to good layout practices is always recommended. Keep traces short. When possible, use a PCB ground plane with surface-mount components placed as close to the device pins as possible. Place a 0.1 μ F capacitor closely across the supply pins. These guidelines should be applied throughout the analog circuit to improve performance and provide benefits such as reducing the EMI susceptibility.

9 Application Note

Fig.9-1. 60 Hz Twin "T" Notch Filter

Small signals from transducers in remote and distributed sensing applications commonly suffer strong 60 Hz interference from AC power lines. The circuit of Fig.10-1. notches out the 60 Hz and provides a gain $A_V = 2$ for the sensor signal represented by a 1 kHz sine wave. Similar stages may be cascaded to remove 2nd and 3rd harmonics of 60 Hz. Thanks to the nA power consumption of the GT810X, even 5 such circuits can run for 9.5years from a small CR2032 lithium cell. These batteries have a nominal voltage of 3 V and an end of life voltage of 2 V. With an operating voltage from 1.6 V to 5.5 V the GT810X can function over this voltage range.

The notch frequency is set by: $F_0 = 1 / 2\pi RC$.

To achieve a 60 Hz notch use $R = 10 \text{ M}\Omega$ and $C = 270 \text{ pF}$. If eliminating 50 Hz noise, which is common in European systems, use $R = 11.8 \text{ M}\Omega$ and $C = 270 \text{ pF}$.
